

- POW-MIA – Chairman, George Whitfield When DNA isn't enough: How video-photo superimposition helped identify a fallen service member.

For many military reparation cases, identification relies on familiar tools such as DNA, dental records, and medical radiographs. When those methods work, they provide clear and decisive answers.

But some cases fall outside that framework, especially older losses when records are incomplete or biological evidence has been degraded with time. That was the situation in the case of US Army Sgt Rodger Duquesne, who served with A Company, 89<sup>th</sup> Medium Tank Battalion, 25th Infantry Division during the Korean War, and whose remains had been examined repeatedly over decades without a definitive identification.
